

Flow divider with independent phase correction and anticavitation valves for each element

### Code:

9V	NN	M	CC
----	----	---	----

9V	Flow Divider Typology
NN	Number of elements
M	Code of setting range of the valves
CC	Displacement Code

TABLE "M"	
A	10÷ 105 bar
B	70÷ 210 bar
C	140÷ 350 bar

**Example:** Flow divider with two elements (same displacement) :  
XV-3V / 38 x 2 with valve 10 ÷ 105 bar

9V	02	A	78
----	----	---	----

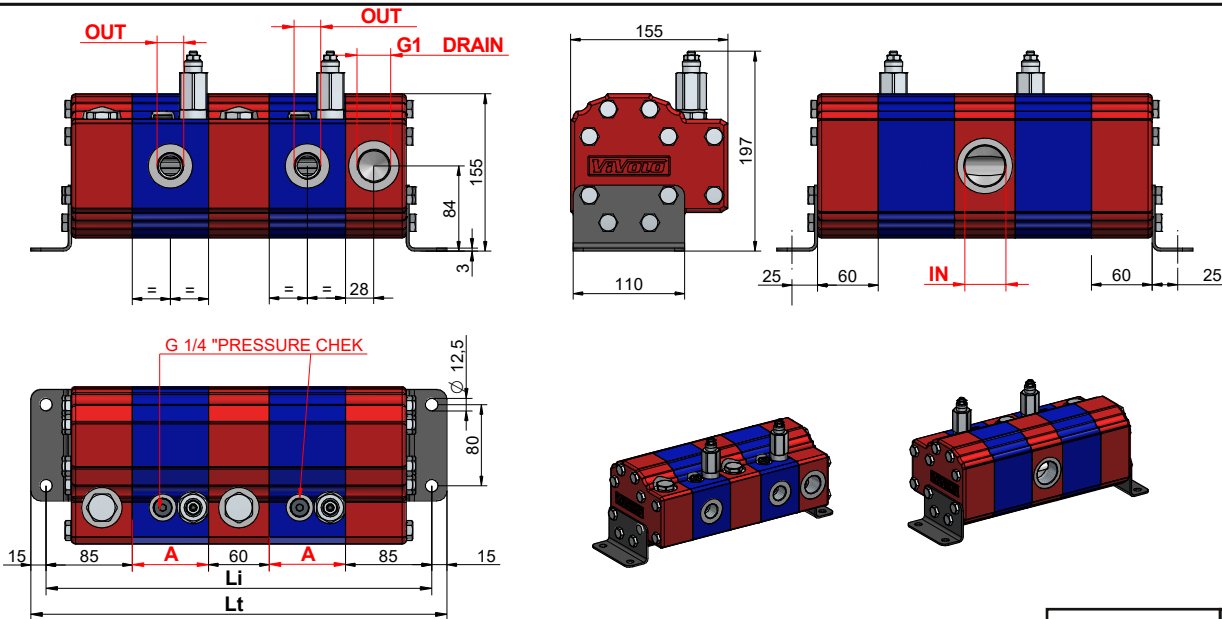

**Example:** Flow Divider with 4 elements with different displacement (max 7):  
XV-3V / 21+51+51+70 with valve 70 ÷ 210 bar

9V	04	B	70	81	81	86
----	----	---	----	----	----	----

**NOTE:** to define codes for flow dividers with more than 7 different displacement, please contact our sales department.

### Table: 1

Displacem. Cm <sup>3</sup> /rev	CC Code	Max Pressure bar	One element flow rate l/min		
			MIN	RECOMMENDED	MAX
15	66	300	18	27	37,5
18	68	300	21,5	32,5	45
21	70	280	25	38	52,5
27	72	250	32,5	48	67,5
32	74	250	38	57	80
38	78	250	41	60	91

**Table: 3** in this table the number of inlets in function of the number of elements are indicated.

Number of elements	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16
"IN" Number of inlets	1	2	2	3	3	4	4	5	5	6	6	7	7	8	8

EXTERNAL DRAIN <i>STANDARD SETUP</i>	INTERNAL DRAIN
<p>For the correct functioning of the flow divider, it has to be installed <i>under the oil level</i>. The drain tube has to pick up under the oil level and it has not to aspire air.</p>	<p>To predispose the divider to the internal drain, plug the 1" G drain port ( T )</p> <p><b>Note:</b> with this configuration the function of anticavitation valves is annulled</p>
	

In **table 1** the functioning range of single flow divider elements is indicated.

The higher is the feeding capacity ( q ), the higher is the precision of flow division, but in opposition there are losses of loading and higher noise. Therefore we suggest to feed the elements with capacities equal or a few superior to the ones indicated in the column "**RECOMMENDED**".

It's important remember to verify the capacities even in phase of flow reunion.

The pressures indicated are to be considered as maximum of functioning, the flow divider is able to bear peaks of pressure 20% superior.

**How to calculate the "Li" and "Lt" measures of flow dividers:**

From **table 2** it is possible to obtain the "Li" measure for flow dividers up to 16 elements with equal displacements; for flow dividers with different elements or with more than 16 elements the "Li" and "Lt" measure have to be calculated by the following formula:

$$Li = [(n-1) \times 60] + 170 + (A1 + A2 + A3 + \dots)$$

$$170 = 85 + 85$$

n = Number of elements of flow divider

A1... An = heights of elements of flow divider

$$Lt = Li + 30$$

$$30 = 15 + 15$$

**EXAMPLE:** To obtain the measures **Li** and **Lt** of a flow divider with three elements (n=3), **XV-3V 27 + 38 + 54**

Distance between fixing hole centres

$$Li = [(3-1) \times 60] + 170 + 75 + 85 + 98 = 548 \text{ mm}$$

Total Length

$$Lt = 548 + 30 = 578 \text{ mm}$$

In **table 3** the number of inlets in fuction of the number of elements are indicated.

For flow dividers with many inlets, as they are all communicating it is even possible to use only one of them, by plugging the other ones. We suggest to use at least one 1" BSP inlet every 200 l/min capacity and at least one 1-1/4" BSP inlet every 360 l/min capacity

To obtain errors of division inferior to 3% there must be no difference of pressure between the elements superior to 30 bar. To obtain high precisions the respect of the following parametres is also important:

- Environment temperature: -10°C ÷ +60°C                      Oil temperature: +30°C ÷ +60°C
- Hydraulic oil based on hlp, hv (din 51524) minerals      Oil Viscosity 20 ÷ 40 cSt
- Oil filtering 10 ÷ 25 µ
